

Named as one of the fastest growing companies in BC last year, Atimi Software has been integral in helping companies of all sizes achieve their target goals by enabling them to expand their product offering into a growing Mac market.

We have ported Windows applications to the Mac with over 20 million lines of code, brought Mac support to GPS devices and helped multiple Fortune 500 companies get their current Mac software to the market as a Universal Binary (to support both the PowerPC and Intel chipset).

Working with Atimi is flexible. We can build your idea from scratch, expand the functionality of an existing product, or augment a team that you already have in place to beat your competition to market or hit that deadline. We offer both fixed price and time and materials contracts to suit your needs.

## Atimi Partner Program

The Atimi Partner Program (APP) is a unique software development program that enables technology companies to have access to one of the largest and most experienced Mac OS X development teams.

### Why we are launching APP? Because it's time.

Our clients are telling us it's time they started getting serious about the Apple market. Waiting on the sidelines is no longer an option. Millions of users have Apple computers and portable devices for both personal and corporate use. Technology companies who have ignored Apple are losing out on the fastest growing market segment.

### So if you make software or hardware and it doesn't operate with Apple products, isn't it time it did?

For software and hardware makers, having ready access to the people and skills they need to make their products Apple compatible saves them time and money. Their product releases in both Windows and Mac OS X simultaneously. They access a larger portion of the market and they have a competitive edge over single-platform products. By using the on-demand model of APP, they can invest in the core product instead of spending precious development dollars on cyclical skills.

For services companies, our clients are telling us that Apple product compatibility is becoming a standard requirement. These established service providers are challenged to find the right people at the right time. As a service company, it's an advantage to be able to pursue Mac OS X business and use APP for that portion of the venture.
